    /*
     * In Linux 2.6.39 the O_PATH flag was introduced that allows to obtain
     * a descriptor without actually opening file or directory.  It requires
     * less permissions for path components, but till Linux 3.6 fstat() returns
     * EBADF on such descriptors, and fstatat() with the AT_EMPTY_PATH flag
     * should be used instead.
     *
     * Three scenarios are handled in this function:
     *
     * 1) The kernel is newer than 3.6 or fstat() with O_PATH support was
     *    backported by vendor.  Then fstat() is used.
     *
     * 2) The kernel is newer than 2.6.39 but older than 3.6.  In this case
     *    the first call of fstat() returns EBADF and we fallback to fstatat()
     *    with AT_EMPTY_PATH which was introduced at the same time as O_PATH.
     *
     * 3) The kernel is older than 2.6.39 but nginx was build with O_PATH
     *    support.  Since descriptors are opened with O_PATH|O_RDONLY flags
     *    and O_PATH is ignored by the kernel then the O_RDONLY flag is
     *    actually used.  In this case fstat() just works.

11
12
13  /*
14  * Although FreeBSD sendfile() allows to pass a header and a trailer,
15  * it cannot send a header with a part of the file in one packet until
16  * FreeBSD 5.3.  Besides, over the fast ethernet connection sendfile()
17  * may send the partially filled packets, i.e. the 8 file pages may be sent
18  * as the 11 full 1460-bytes packets, then one incomplete 324-bytes packet,
19  * and then again the 11 full 1460-bytes packets.
20  *
21  * Therefore we use the TCP_NOPUSH option (similar to Linux's TCP_CORK)
22  * to postpone the sending - it not only sends a header and the first part of
23  * the file in one packet, but also sends the file pages in the full packets.
24  *
25  * But until FreeBSD 4.5 turning TCP_NOPUSH off does not flush a pending
26  * data that less than MSS, so that data may be sent with 5 second delay.
27  * So we do not use TCP_NOPUSH on FreeBSD prior to 4.5, although it can be used
28  * for non-keepalive HTTP connections.

14  * It seems that Darwin 9.4 (Mac OS X 1.5) sendfile() has the same
15  * old bug as early FreeBSD sendfile() syscall:
16  * http://bugs.freebsd.org/33771
17  *
18  * Besides sendfile() has another bug: if one calls sendfile()
19  * with both a header and a trailer, then sendfile() ignores a file part
20  * at all and sends only the header and the trailer together.
21  * For this reason we send a trailer only if there is no a header.
22  *
23  * Although sendfile() allows to pass a header or a trailer,
24  * it may send the header or the trailer and a part of the file
25  * in different packets.  And FreeBSD workaround (TCP_NOPUSH option)
26  * does not help.
27  */

15  * To change the process title in Linux and Solaris we have to set argv[1]
16  * to NULL and to copy the title to the same place where the argv[0] points to.
17  * However, argv[0] may be too small to hold a new title.  Fortunately, Linux
18  * and Solaris store argv[] and environ[] one after another.  So we should
19  * ensure that is the continuous memory and then we allocate the new memory
20  * for environ[] and copy it.  After this we could use the memory starting
21  * from argv[0] for our process title.
22  *
23  * The Solaris's standard /bin/ps does not show the changed process title.
24  * You have to use "/usr/ucb/ps -w" instead.  Besides, the UCB ps does not
25  * show a new title if its length less than the origin command line length.
26  * To avoid it we append to a new title the origin command line in the
27  * parenthesis.
